The National Cervical Screening Programme also has the following resources:
- Cervical Smear tests: what women need to know
- Cervical Screening: a guide for women in New Zealand
- Understanding cervical smear test results
- Colposcopy: information for women who have abnormal cervical smear results.

Ngā hua o te tirohanga
Your results

The majority of women will have normal results.

Some women may be asked to go back for another test if there were not enough cells to look at, or if there are changes. An abnormal result hardly ever means cancer.

Your results will be sent to the National Cervical Screening Register to assist in recalling you for your next smear.

Kia mōhio noa iho koe
Just so you know

Smear tests are the best way of showing cell changes in the cervix. However, occasionally cell changes may be missed and a normal result given. The missed changes will usually be picked up in the next three yearly smear test. Sometimes a result may show abnormal cells when all is actually well. Another smear may be taken and will usually show that no treatment is needed.

Who needs a smear test?
All women who have ever been sexually active are advised to have a smear test every three years from the time they turn 20 until they turn 70.

Who does the test?
The test can only be done by trained smear takers. You can find smear takers at:
- Your nearest Whare Rapuora – Māori health centre
- Your iwi Māori health providers
- Your GP’s clinic – there are many female GP’s or practice nurses who take smears
- Family Planning/sexual health centres.

What happens during the test?
Having a smear only takes a few minutes. Some women find it a little uncomfortable, but it should not hurt.
A few cells will be collected from your cervix (the neck of the womb) and ‘smeared’ onto a glass slide for testing. The test looks for abnormal cells. Any abnormal cells are treated to stop them from becoming cancer.
There is now another option for preparing cells from the cervix for testing. This may cost extra. Your smear taker will discuss whether this option is right for you.

Be aware of HPV
Cervical cancer is caused by a virus called human papillomavirus or HPV which is sexually transmitted. HPV affects almost all people at some point in their lives.
There are many types of HPV, but only a few types will cause cell changes in the cervix. These changes can return to normal or they may later become cancer if not treated.
Having regular smear tests every three years is the best way of finding and treating any cell changes and preventing cervical cancer from developing.

If you change your address please advise your smear taker and the National Cervical Screening Programme Freephone 0800 729 729

What does a smear test cost?
You may be charged the usual fee from your doctor or nurse. Some Māori providers or community or primary health organisations offer a free or low cost service.
